Which of the following	ng statements about Tries is generally false?							
a. Tries offer w	orst-case search time that is better than a hash table.							
ob. Tries can be	used to implement auto-completion features.							
c. The height o	of a Trie is bounded by the length of the longest word stored.							
<ul><li>d. Tries are eff</li></ul>	icient for storing numeric data.							
Question 2

In a Trie, which scena	rio leads to the most efficient search operation?							
a. Searching fo	or a word that shares a long common prefix with many other words in the Trie.							
<ul><li>b. Searching for</li></ul>	or a word that has no common prefix with any other word in the Trie.							
c. Searching for	or a very long word that is not present in the Trie.							
d. Searching fo	or a very short word that is present in the Trie.

Question 4	
Complete	
Mark 0.00 out of 1.00	

What is the primary advantage of using a Trie over a standard hash table for storing a dictionary of words?

- a. More efficient storage of a small number of keys
- b. Ability to efficiently find all words with a given prefix
- oc. Guaranteed constant-time search for all words
- d. Faster average-case insertion

o	 _	-	H	_	n	5

Consider a Trie node. Which statement best describes the role of its 'children' attribute (a map of characters to Trie nodes)?

- a. It stores all possible next characters in the alphabet.
- b. It stores the next characters for all words that pass through this node.
- oc. It stores the next characters for the longest word passing through this node
- d. It stores the next characters for all words that end at this node.

Mark 0.00 out of 1.00
```

4/29/25, 3:22 PM

```
TrieNode root = new TrieNode();
// Assume words "apple", "apricot", "banana" are inserted.
String findPrefix(String word) {
    TrieNode node = root;
    StringBuilder prefix = new StringBuilder();
    for (char c : word.toCharArray()) {
        if (node.children.containsKey(c)) {
            prefix.append(c);
            node = node.children.get(c);
        } else {
            break;
        }
    }
    return prefix.toString();
}
```

a. "apricot"b. "a"d. ""

## Question 7 Complete Mark 0.00 out of 1.00

```
// Standard TrieNode structure
void insertWord(String word, TrieNode node, int index) {
  if (index == word.length()) {
    node.isEndOfWord = true;
    return;
  }
  char c = word.charAt(index);
  if (!node.children.containsKey(c)) {
    node.children.put(c, new TrieNode());
  }
  insertWord(word, node.children.get(c), index + 1);
}
```

// If insertWord("hello", root, 0) is called, how many recursive calls will be made to insertWord?

- a. 1
- <a>b. 6</a>
- c. 2
- Od. 5

## Question 8

Complete

Mark 1.00 out of 1.00

In a Trie used for autocomplete, how does the algorithm determine which words to suggest for a given prefix?

- a. It randomly selects words from the Trie.
- b. It uses a hash table to store words by prefix.
- o. It traverses the Trie path corresponding to the prefix and performs a depth-first search on the subtree rooted at the end of that path.
- d. It searches the entire Trie for words starting with the prefix.

```
Question 9
Complete
Mark 1.00 out of 1.00
```

```
boolean wordSearch(String word, TrieNode node, int index) {
   if (index == word.length()) {
      return node.isEndOfWord;
   }
   char c = word.charAt(index);
   if (node.children.containsKey(c)) {
      return wordSearch(word, node.children.get(c), index + 1);
   }
   return false;
}

// What is the return value of wordSearch("car", root, 0) if only "car", "cart" and "cat" are inserted?

a. null
b. false
c. true
d. Depends on the root node
```

## Question 10

Complete

A Trie is used to store a large dictionary. Which optimization would most significantly reduce its memory footprint?

- a. Compressing non-branching paths into single edges (e.g., "appl" instead of 'a'->'p'->'l').
- b. Storing words in sorted order during insertion.
- o. Using a linked list instead of a HashMap for children.
- od. Using a smaller character set.
